On reduction, an azo dyestuff undergoes cleavage at each of the azo groups which it may contain, each nitrogen atom of each azo radical yielding an amino group. Hence one of the reduction products must always be identical with a first component except in cases when the first component itself contains reducible groups. Second and third components, on the contrary, are not obtained as reduction products, but we secure in their place their amine derivatives. Thus, Congo Red, which has benzidine as its first, and naphthionic acid as its second component, gives benzidine as its first reduction product, and di-aminonaphthalenesulphonic acid as its second reduction product. $C_6H_4.N_2C_1.CeH.N_2.C.OH_2.(SO_2H)(NH_2)_2$ C, 0He. $(NH_2)(SO_2H)_2$ HC1 C. Absorption Spectra. Determine the exact positions in wave lengths of the maxima of the absorption bands appearing in the spectrum obtained by passing a beam of white light through a solution of the dyestuff into a spectrometer provided with cross hairs, a carefully calibrated scale, and a micrometer screw movement. The technique of the method may best be learned by a series of practice exercises, consulting Formaneks manuals (cf. p. 3) for detailed working directions. Observations. --The analyst who is provided with a suitable...
