Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1911 edition. Excerpt: . . . for this change to take place. Then the average e. m. . induced in the circuit during this interval is numerically E -----provided each line of induction links each turn, and therefore the average value of the induced current is R Rt or f N R But t is the quantity of electricity which flows through the circuit in this interval. Hence the important relation that, when the number of lines of induction linking a coil of N turns is changed by an amount--cf2, a quantity of electricity Q(cf-cf,) N (5) R is transferred across each section of the wire forming the circuit, where R is the total resistance of the circuit, where all quantities are in c. g. s. units. Hence, if when a coil which forms part of a circuit which has a total resistance of R abohms is pulled quickly out of a magnetic field, a quantity of Q abcoulombs of electricity is discharged through the circuit, the number of lines of induction in maxwells which threaded the coil when it was in the field is (5a) Or, if the coil is reversed in the field (i. e. , turned 180 degrees about any axis in the plane of the coil), or if the direction of the field through the coil is reversed, the number of lines of induction in maxwells originally threading the coil is When a momentary current is established in a galvanometer of which the moving element...
